Funded by the Department of Environment and Climate Change

Zone 2

What to expect by the 2030s for a high emissions scenario

Warmer Winters

Colder temperatures will happen much less frequently

+2.7°C

average winter Temperature increase

60%

less deep freeze events

Shorter Winters

Later Winters and earlier Springs

Duration from first to last snowfall

3-4

weeks shorter

35%

less Average total winter snowfall

Wetter Winters

More rainy days and heavier rainfalls

65%

more average total winter rain

60%

more winter rain events over 10 mm.

Shrinking Snowpacks

Thinner snowpacks and less days with snow cover

48%

less average snow depth

50%

less days with snow cover more than 15cm

Shorter Snow-making Season

Negligible changes in average Winter humidity

For operating temperatures below

-2°C

-5°C

-10°C

by 4

weeks

by 5

weeks

by 6

weeks

Potential Operational Impacts Of Climate Change

Increased frequency of **temporary closures**

Increased **grooming and maintenance** requirements

More **wet or icy conditions** creating health and safety concerns

Shorter operating season lengths due to shorter winters and **less snow**

Winter recreation operations **typically close** during days with **more than 10 mm** of rain.

Increased snowmaking and snow storage capacities **required** to maintain operations.

Snowmaking will **start later** and **end earlier**

Equipment with higher snowmaking temperatures will have **longer operating seasons**

All future changes are calculated relative to the historical baseline of 1981 – 2010.

Understanding the impacts of climate change allows the industry and local operators to prepare and adapt to future conditions, unlocking new and innovative ways to successfully operate during the winter season.
